2			**DR** $4\sin x° = 3\cos x°$ $\tan x° = \frac{3}{4}$ $x° = 36.9°,\ 216.9°$	**M1** **M1** **A1** **[3]**	**1.1a** **1.1a** **1.1**	Attempt to solve simultaneously Using trig identity to form equation in $\tan x$ Both answers required with no extras in the interval. ISW answers outside $0° \le x° \le 360°$	Answers must be given to 1 dp (in question)
			Alternative method $4\sin x° = 3\cos x°$ $\Rightarrow 16\sin^2 x° = 9\cos^2 x°$ $\sin^2 x° = \frac{9}{25}$ or $\cos^2 x° = \frac{16}{25}$ $x° = 36.9°,\ 143.1°, 216.9°, 323.9°$ Check solutions satisfy the original equation to give $x° = 36.9°,\ 216.9°$	**M1** **M1** **A1** **[3]**	**1.1a** **1.1a** **1.1**	Attempt to solve simultaneously Using trig identity $\sin^2 x° + \cos^2 x° = 1$ to form equation in $\sin^2 x°$ or $\cos^2 x°$ Both answers required with no extras in the interval. ISW answers outside $0° \le x° \le 360°$
