6	**(a)**		(2, 11) on the graph tells Kai that the displacement from the origin at that time is 11 m and not the distance travelled. [The particle starts 7 m from the origin, so actual distance travelled is 11 – 7 = 4 m]	**E1** **[1]**	**2.3**	Draws a clear distinction between displacement from the origin at $t = 2$ and the distance travelled	Allow for a statement that the displacement during the first 2 s is 4 m
6	**(b)**		When $t = 10$, $s = -53$ Distance travelled is $53 + 11 + 4$ $= 68$ m	**M1** **M1** **A1** **[3]**	**1.1** **1.1** **1.1**	Evaluating displacement or distance from the origin at $t = 10$ soi Adds at least one distance to their 53m	May be implied by substitution seen or by –53 seen or by [distance of] 53 m
6	**(c)**		$v = \frac{ds}{dt} = 4 - 2t$	**M1** **A1** **[2]**	**1.1a** **1.1**	Attempt to differentiate	
6	**(d)**		When $t = 10$ $v = 4 - 2\times10$ [–16] therefore the speed is 16 m s^{-1}	**M1** **A1** **[2]**	**3.4** **3.2a**	Substitution of $t = 10$ soi Allow for speed = 16 m s^{-1} seen www	Allow **M1A0** for speed -16 m s^{-1} seen or for $4 - 2\times10 = 16$
