Question			Answer	Marks	AOs	Guidance	
7			$y = \int \left(6x + \frac{8}{x^3}\right) \mathrm{d}x = \int (6x + 8x^{-3}) \mathrm{d}x$	**M1**	**2.1**	Attempt to integrate with a negative power. Condone missing $+c$	
			$= 6 \times \frac{x^2}{2} + 8 \times \frac{x^{-2}}{-2} + c$	**A1**	**1.1**	First two terms correct. Condone missing $+c$	
			When $x = 1, y = 0$ $0 = 3 \times 1^2 - 4 \times 1^{-2} + c$ giving $c = 1$	**M1**	**2.1**	Attempt to evaluate c	
			So $y = 3x^2 - 4x^{-2} + 1$	**A1**	**1.1**	Correct equation for the curve soi	
			When $x = 2$, $y = 3 \times 2^2 - 4 \times 2^{-2} + 1 = 12 - 1 + 1 = 12$	**M1**	**2.1**	Using $x = 2$ in their non-linear equation	
			So the point (2, 12) lies on the curve.	**E1** **[6]**	**2.2a**	Conclusion from their y-value FT
