Question			Answer	Marks	AO	Guidance
5	(a)		$y = \tan(ax°)$ $y = \tan\left(\frac{3}{2}x°\right)$	B1 B1 [2]	1.2 1.1b	For any $a \neq 1$ with no other transformation o.e. SC 1 for just $f\left(\frac{3}{2}x\right)$ o.e. seen
5	(b)		120°	B1 [1]	1.1b	cao
5	(c)		**DR** $\arctan 1 = 45°$ $x = \frac{2}{3} \times 45° = 30°$ function is periodic with period 120° so roots are 30°, 150°, 270°	 M1 M1 B1 [3]	 1.1a 2.1 1.1b	 Complete method for solving their $y = 1$ leading to at least one root. Do not allow where their $y = \tan x$ Appropriate use of the periodicity of their y or $\tan x$ leading to at least one more root Cao Allow for all the roots seen and no extras in the interval [0°, 360°] Ignore values outside this range
