Question			Answer	Marks	AO	Guidance
8			$(2x+3)^2 - 4x^2 = 33$	**B1**	**3.1a**	substitution to eliminate *y*
			$4x^2 + 12x + 9 - 4x^2 = 33$ Or $12x + 9 = 33$	**M1**	**2.1**	Expansion of the quadratic to obtain a **correct equation, allow one sign error or one coefficient error**, this can be implied by a correct linear equation.
			$x = 2$	**A1**	**1.1**	Progress to solve and obtain correct value
			(2, 7) **cao**	**A1**	**1.1**	
			Alternative: $y^2 - 4\left(\frac{y-3}{2}\right)^2 = 33$	**B1**	**3.1a**	substitution to eliminate *x*
			$y^2 - (y^2 - 6y + 9) = 33$ Or $6y - 9 = 33$	**M1**	**2.1**	Expansion of the quadratic to obtain a **correct equation**, **allow one sign error or one coefficient error** this can be implied by a correct linear equation.
			$y = 7$	**A1**	**1.1**	Progress to solve and obtain correct value
			(2, 7) **cao**	**A1**	**1.1**
