14 An environmental scientist is monitoring the fish population in a river. One day he catches some fish from a certain pool on the river. He weighs each fish before returning them all unharmed to the river.

The results are displayed in the histogram.

(a) Use the information in the histogram to determine an estimate of the percentage of fish in the river that weigh at least 40 grams. **[3]**

(b) Identify a limitation of your answer to part **(a)**. **[1]**
