| Question | Answer | Mark | Mark scheme |
|---|---|---|---|
| 23 (a) | Mistake identified | C1 | for identifying the mistake<br><br>**Acceptable examples**<br>$p - 5$ should be multiplied by 3<br>$(-)5$ should be multiplied by 3<br>All of left side / everything should be multiplied by 3<br>He failed to multiply the 5 as well<br>He should have / didn't put brackets around the $p - 5$<br>(The $3p - 5$) should be $3p - 15$<br>(The $- 5$) should be $- 15$ / (the 5) should be 15<br>(The answer should be) $m = 3p - 15$ / $m = 3(p - 5)$<br>He only times the $p$ by 3<br><br>**Not acceptable examples**<br>The first line should be $3p = m + 5$<br>He should have multiplied everything<br>Ben didn't divide $p - 5$ by 3<br>He failed to multiply the $p - 5$<br>He failed to multiply the $(-)5$<br>He only times the $p$<br>He should have multiplied by 3 first<br>He only multiplied one side by 3<br>He needs to get rid of the fraction<br>Should have used brackets<br>Just circling the $3 \times p - 5$ and / or the $m = 3p - 5$<br>Needs to multiply the 5 by $-3$<br>He should have done $p - 5 \times 3$ |

| Question | Answer | Mark | Mark scheme | Additional guidance |
|---|---|---|---|---|
| (b) | $2xy(x^2 + 2y)$ | B2 | for $2xy(x^2 + 2y)$ oe eg $2(x^2 + 2y)xy$ | |
| | | (B1 | for $2x(x^2y + 2y^2)$ **or** $2y(x^3 + 2xy)$ **or** $xy(2x^2 + 4y)$ | |
| | | | **or** for correctly identifying the HCF in the factorisation of the form $2xy(ax^2 \pm ...)$ **or** $2xy(... \pm by)$ where $a$ and $b$ are integers | ... can be numerical or algebraic but not equal to 0 or absent |
| | | | **or** $(x^2 + 2y)$ as a factor eg $2x(x^2 + 2y)$ | |
