				[2]			
5	**(i)**		$\mathbf{v}=\dfrac{\mathrm{d}\mathbf{r}}{\mathrm{d}t}=(12-2\times 2t)\mathbf{i}+(2t-6)\mathbf{j}$	**M1** **A1** **[2]**	**1.1a** **2.5**	Attempt to differentiate at least one coefficient Must use vector notation	
	(ii)		When $t=3$ both components of velocity are zero, so the particle is stationary at $t=3$.	**M1** **E1** **[2]**	**3.1a** **2.2a**	Equating at least one component of their vector velocity to zero Must be argued from two zero components	Do not allow M1 for solving $12-4t=2t-6$ unless at least one zero subsequently established
