Question			Answer	Marks	AO	Guidance
2			$x^2-x-12=(x-4)(x+3)$	**B1**	**1.1a**	both factors seen
			$\frac{5x+1}{x^2-x-12}=\frac{A}{x-4}+\frac{B}{x+3}$	**M1**	**1.1a**	setting up partial fractions using their factors. May be implied by correct expression as final answer.
			$5x+1=A(x+3)+B(x-4)$			
			Substitute $x=-3$	**M1**	**1.1b**	method for finding either A or B soi
			giving $B=2$			
			substitute $x=4$ giving $A=3$	**A1**	**1.1b**	both A and B correct if clear which denominator they apply to
			$\frac{5x+1}{x^2-x-12}=\frac{3}{x-4}+\frac{2}{x+3}$			ISW if an error made only in the transcription to final answer
