Question			Answer	Marks	AO	Guidance
3			$\int\left(2x^4 - x\sqrt{x}\right)\mathrm{d}x = \int\left(2x^4 - x^{3/2}\right)\mathrm{d}x$	**M1**	**3.1a**	Expresses integrand in index form soi
			$\frac{2x^5}{5} - \frac{x^{5/2}}{5/2}[+c]$	**M1**	**1.1b**	Integrates at least one term
			$\frac{2x^5}{5} - \frac{2x^{\frac{5}{2}}}{5} + c$	**A1**	**1.1b**	Any form. Arbitrary constant must be seen. Correct answer for the second term by a different method implies the first M1
				[3]
