13	**(a)**		Lee is wrong because he should make the comparison of 0.033 with 0.05 he should make the comparison of 0.37154 with 0	**B1** **B1** **[2]**	**2.2a** **2.2b**	allow he should have compared *r* with the critical value	if **B0B0** **SC1** for Lee has confused *r* with *p* **or** for 0.37154 suggests positive correlation

Question			Answer	Marks	AOs		Guidance
13	(b)		465467 + 2×204356	M1	2.1	condone use of 201236 instead of 204356; ignore work relating to lower tail	or 521000 + 1.5 × (521000 – 342500)
			awrt 874180 (or 867940 from use of 210236) from scatter diagram the outliers are approximately 920 000, 1 200 000	A1 [2]	2.2b	numerical values must be mentioned	or 788750 in which case accept two **or** three outliers identified extra one is approximately 800 000
13	(c)		the pmcc would (probably) be closer to 0 because the scatter is less well modelled by a straight line	B1	2.2b	if **B0B0** allow **SC1** for *r* closer to 0 and *p*-value larger	
			the *p*-value would increase because a value which is closer to 0 is more likely assuming there is no correlation	B1 [2]	2.2b		
13	(d)		the student's suggestion is reasonable, since there are other regions defined in the LDS	B1 [1]	2.2b
