				[2]		
5			$2^n - 1$ correctly evaluated for any odd positive integer $2^n - 1$ correctly evaluated for any odd positive integer for which Tom's conjecture is false eg 511 is divisible by 7 with 9 seen [so not prime]	**B1** **B1** **B1**	**1.1** **2.1** **2.2a**	$n \geq 3$ **B0** if only rounded number in standard form seen eg $2^9 - 1 = 511$, eg $2^{15} - 1 = 32767$ eg $2^{21} - 1 = 2097151$ **NB** 32767 and 2097151 both divisible by 7; 2047 divisible by 23 correct value of *n* may be embedded in formula **NB B0** if answer spoiled by eg so 511 is prime
