15			Suppose that for the given perimeter, $4L$, there is a rectangle which is larger in area than the square. There is a square which has the same area as this rectangle but a smaller perimeter so its side is less than L. The square with side L has perimeter $4L$ and an area larger than the given rectangle. This is a contradiction so the square must have the largest area of all rectangles with given perimeter.	**M1** **A1** **A1** **[3]**	**2.5** **3.1a** **2.2a**	Setting up a statement for contradiction. Use of statement in line 31-32 Completion to correct conclusion, including contradiction
