Question			Answer	Marks	AOs	Guidance	
1	(a)		$y = 3x - 2$ so $x = \dfrac{y+2}{3}$ $\mathrm{f}^{-1}(x) = \dfrac{x+2}{3}$	**M1** **A1** **[2]**	**1.1a** **1.1**	Condone '$y =$' but eg '$f(x) =$' does not score	
1	(b)			**B1** **B1** **[2]**	**1.1** **1.1**	$y = 3x - 2$ going through (0, –2) Or $\mathrm{y} = \dfrac{x+2}{3}$ going through (0, 2/3) $y = \mathrm{f}^{-1}(x)$ a reflection of $y = \mathrm{f}(x)$ in $y = x$ Both graphs linear to get B2	Line of symmetry roughly at 45° or implied by coords
1	(c)		$3x - 2 = x$ when $x = 1$ $x > 1$	**M1** **A1** **[2]**	**3.1a** **2.2a**	Attempt to find when $\mathrm{f}(x) = x$ or attempt to solve $3x - 2 = \dfrac{x+2}{3}$ or $3x - 2 > \dfrac{x+2}{3}$ soi by $x = 1$	Using *their* inverse
