11			Let $u = 1+\sqrt{x}$ $\Rightarrow \mathrm{d}x = 2(u-1)\mathrm{d}u$ or $dx = \dfrac{du}{\frac{1}{2}x^{-\frac{1}{2}}}$ oe or $2\sqrt{x}du$	**M1**	**1.1**		
			$\int \dfrac{x}{1+\sqrt{x}}\mathrm{d}x = \int \dfrac{2(u-1)^3}{u}\mathrm{d}u$ oe	**A1**	**1.1**	In terms of u	
			$\int \dfrac{2(u^3-3u^2+3u-1)}{u}\mathrm{d}u$	**M1**	**1.1**	For expanding cubic (allow one error)	
			$\int 2\left(u^2-3u+3-\dfrac{1}{u}\right)\mathrm{d}u$	**M1**	**3.1a**	Dividing by u	
			$\dfrac{2u^3}{3}-3u^2+6u-2\ln\lvert u\rvert+c$	**M1**	**1.1**	3 of *their* terms correctly integrated to inc ln$u$. Constant term may be missing at this stage	Condone omission of modulus (since $1+\sqrt{x}$, and hence u, must be positive)
			$\dfrac{2\left(1+\sqrt{x}\right)^3}{3}-3\left(1+\sqrt{x}\right)^2+6\left(1+\sqrt{x}\right)-2\ln\left\lvert 1+\sqrt{x}\right\rvert+c$ oe	**A1** **[6]**	**2.5**	Correct answer in terms of x with constant term
