**5** $M$ is the event that an A-level student selected at random studies mathematics.

$C$ is the event that an A-level student selected at random studies chemistry.

You are given that $P(M) = 0.42$, $P(C) = 0.36$ and $P(M \text{ and } C) = 0.24$. These probabilities are shown in the two-way table below.

| | $M$ | $M'$ | Total |
|---|---|---|---|
| $C$ | 0.24 | | 0.36 |
| $C'$ | | | |
| Total | 0.42 | | 1 |

**(a)** In the **Printed Answer Booklet**, complete the copy of the two-way table. **[2]**

**(b)** Calculate the probability that an A-level student selected at random does **not** study chemistry **given that** they do **not** study mathematics. **[2]**
