11 Show that, for the angle 45°, the formula $\sin\theta \approx \dfrac{4\theta(180-\theta)}{40\,500-\theta(180-\theta)}$ given in line 28 gives the same approximation for the sine of the angle as the formula $\sin x \approx \dfrac{16x(\pi-x)}{5\pi^2-4x(\pi-x)}$ given in line 23. **[3]**
