

| Question | Answer                      | Mark | Mark scheme                                                                                                                        | Additional guidance                       |
|----------|-----------------------------|------|------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------|
| 13 (a)   | $\frac{17x + 2}{3x(x + 1)}$ | M1   | for a correct common denominator with at least one correct numerator<br>eg. $\frac{5 \times 3x}{3x(x+1)} + \frac{2(x+1)}{3x(x+1)}$ |                                           |
|          |                             | A1   | for a single simplified fraction,<br>eg. $\frac{17x+2}{3x(x+1)}$ or equivalent eg. $\frac{17x+2}{3x^2+3x}$                         | $\frac{15x+2(x+1)}{3x(x+1)}$ gets M1 only |
| (b)      | $(x + y)(x + y + 3)$        | B1   | cao                                                                                                                                |                                           |
