

Question	Working	Answer	Mark	Notes
14		$\frac{x + 4}{2x + 3}$	M1	Factorising the denominator $(2x \pm 3)(x \pm 4)$ or $2\left(x \pm 1\frac{1}{2}\right)(x \pm 4)$
			M1	Factorising the numerator $(x - 4)(x + 4)$
			A1	oe
		$v = \frac{15t}{w + 30}$	M1	A correct step towards solution e.g. expanding brackets to get $15t - 30v$ or multiply both sides by v
			M1 A1	For a method to rearrange the formula to isolate terms in v eg $vw + 30v = 15t$ oe
